FUNNGRO WEBSITE REVAMP

SEO Audit Report & Improvement Plan

Desk-based review of publicly visible website content · 29 October 2026

1. Scope and method

This report is a practical desk-based review of publicly visible Funngro pages and search-result content. It is not a server-side crawl and does not claim access to Google Search Console, analytics, Core Web Vitals field data, backlink databases or the site's source configuration. Recommendations should be validated with a crawler and PageSpeed Insights before production changes.

Pages reviewed for content context: the official home page, About page and Press page. The redesigned Teen and Company pages included in this submission are a concept build, not official pages.

Area	Finding / risk	Recommended action	Priority
Page targeting	Teen and company audiences have different goals; a single generic landing page can dilute intent.	Use distinct pages with unique titles, meta descriptions, headings and internal links.	High
Search snippets	Each landing page should explain its audience and value proposition in the first screen.	Use concise, unique title tags and descriptions; avoid keyword stuffing.	High
Heading structure	Pages need one clear H1 and logical H2/H3 sections for users and crawlers.	Keep a single descriptive H1, then use headings to reflect the content hierarchy.	High
Content quality	Claims about earnings, users, brands or payout speed can become outdated and require evidence.	Use current, substantiated figures only; add dates and supporting policy/context where needed.	High
Conversion paths	Teen and company visitors need different calls to action.	Use audience-specific CTAs and link to the appropriate official onboarding destination.	High
Mobile usability	A project challenge should demonstrate a usable mobile layout.	Use responsive navigation, readable text, touch-friendly controls and avoid horizontal overflow.	High
Image performance	Large decorative images can slow down mobile pages.	Compress images, serve modern formats, set dimensions and lazy-load below-the-fold media.	Medium
Structured data	Relevant structured data may help search engines interpret site entities and pages.	Validate Organization/WebSite/WebPage markup with Google Rich Results Test; add only accurate schema.	Medium
Canonical and indexation	Canonical URLs must point to the intended live page, not a temporary preview.	Set self-referencing canonicals after deployment; confirm robots and sitemap rules.	High

Area	Finding / risk	Recommended action	Priority
Internal linking	Important pages should be reachable through descriptive links.	Link Teen, Company, About, FAQ and contact pages naturally; avoid orphan pages.	Medium
Trust and safety	The audience includes teens; clarity and safe participation are important.	Make eligibility, privacy, guardian guidance and terms easy to find and consistent with official policy.	High
Measurement	No analytics/Search Console access was provided for this review.	Track search impressions, clicks, conversions and page performance after deployment.	Medium

2. Implementation in the concept website

• Two separate audience pages: Teen and Company, each with its own page title, meta description, H1, section structure and call to action.

• Responsive layout with mobile navigation, semantic HTML landmarks, descriptive links, readable contrast and keyboard-accessible FAQ disclosures.

• Basic Open Graph metadata and WebPage JSON-LD are included as examples. Validate and adapt structured data before deployment.

• Copy avoids promising guaranteed income or claiming official affiliation. The footer clearly identifies the site as an independent concept redesign.

• Canonical URLs are placeholders that must be changed to the actual deployed concept URLs before publication; do not publish the sample pages under the official domain.

3. Recommended validation before submission

• Run both pages through PageSpeed Insights on mobile and desktop; record LCP, INP and CLS where available.

• Check titles, descriptions, canonical URLs, indexability, sitemap and robots directives using a crawler after hosting.

• Validate HTML and structured data; check keyboard navigation, color contrast and responsive breakpoints.

• Test all navigation and external links on a phone; confirm that the page has no horizontal overflow.

• Add the actual hosted preview URL to the project submission remark and attach this audit PDF.
